

The first version is easy. The edge cases are the job.

I've been shipping software since 2020: marketplaces, e-commerce tools, document and image AI, SaaS dashboards, booking apps, and for the last two and a half years a lending platform used by more than 6,000 people. Different industries, same lesson.

01, what you build

A workflow that's 98% right is a workflow somebody fixes by hand every morning.

I'd rather ship the version that handles every case and explains itself than the one that ships a day earlier.

At Cloover that meant taking the work nobody else wanted to open: a broken reconciliation, the compliance audit behind a guarantee, corrections made directly against production data. I was first reviewer on other people's code, the name new engineers were pointed at, and the one who inherited systems when their builder left.

Today I build for founders and teams who need a product that works end to end, in whatever industry it lives in. Remote from Nairobi, on European hours, with clear scope and no surprises. If that's how you like to work too, let's talk.

02, how you build

Use AI every day. Don't let it decide what's true.

I use agents to trace, test and ship faster. Every output is checked against real data before it reaches production.
